Figure S1.- Sequence alignment of the F proteins from hMPV strain NL/1/00 and hRSV F strain A2 used for variability studies. Identical amino acids are represented by dots, gaps are represented by dashes.

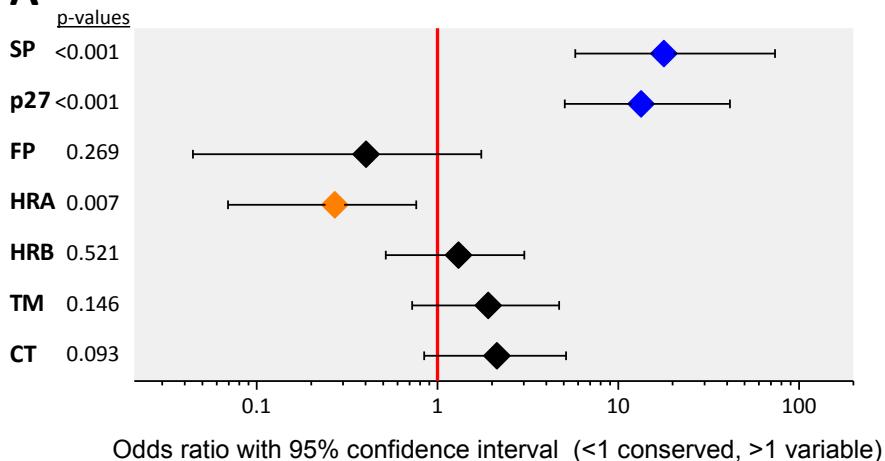

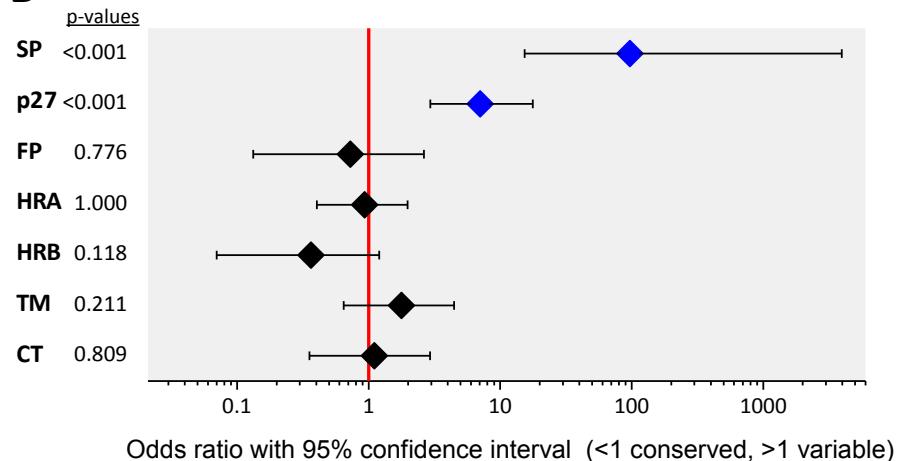

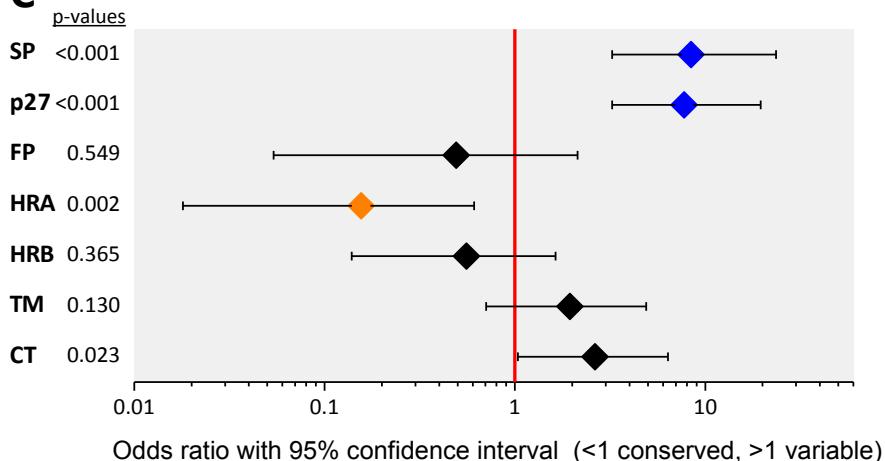

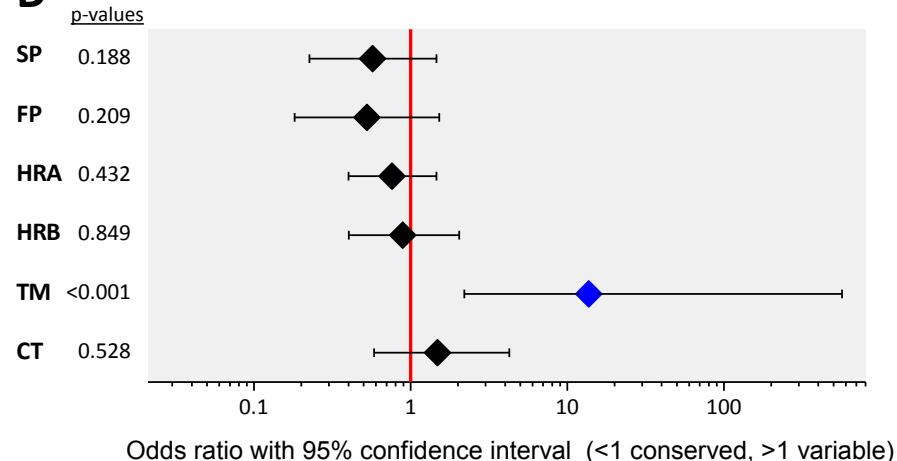

A**B****C****D**

Figure S2.- Probability of mutation in F regions of hRSV group A (A), hRSV group B (B), bRSV (C) and hMPV (D) sequences using the strain A2 as reference sequence. Data are presented as odds ratios with 95% confidence intervals. Significantly ($p<0.05$) increased or reduced values are displayed in blue and orange, respectively, with non-significant odds ratios shown in black.

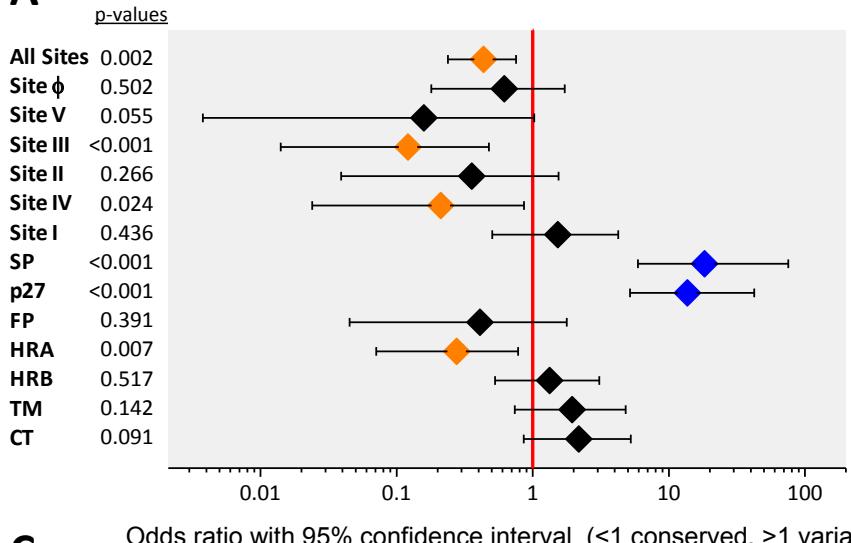

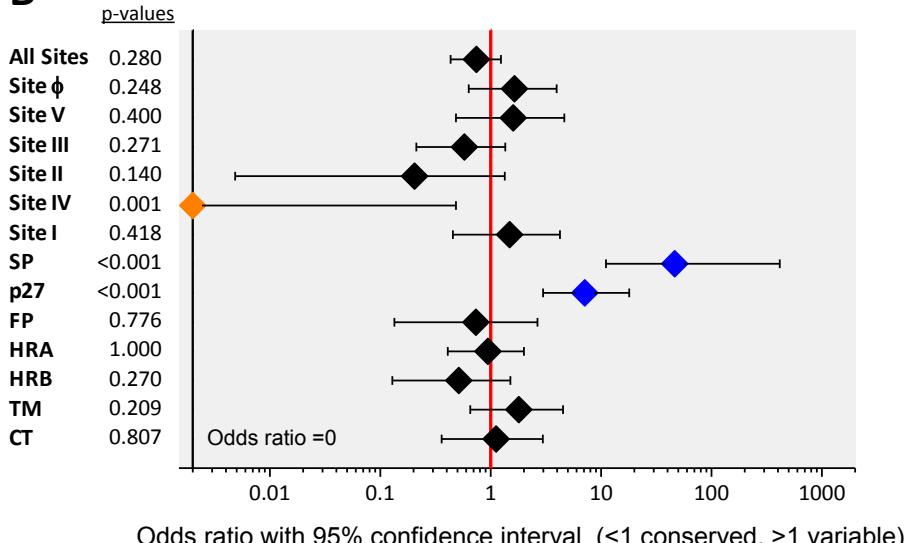

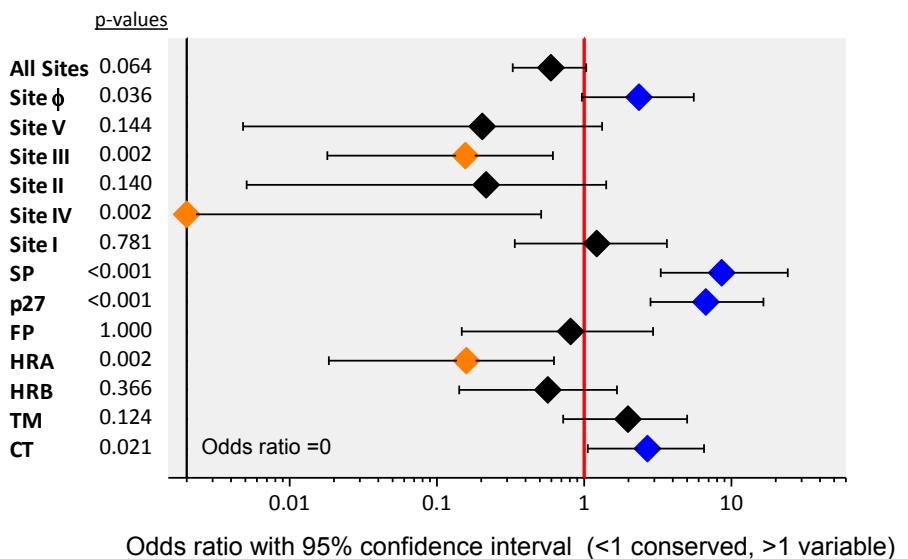

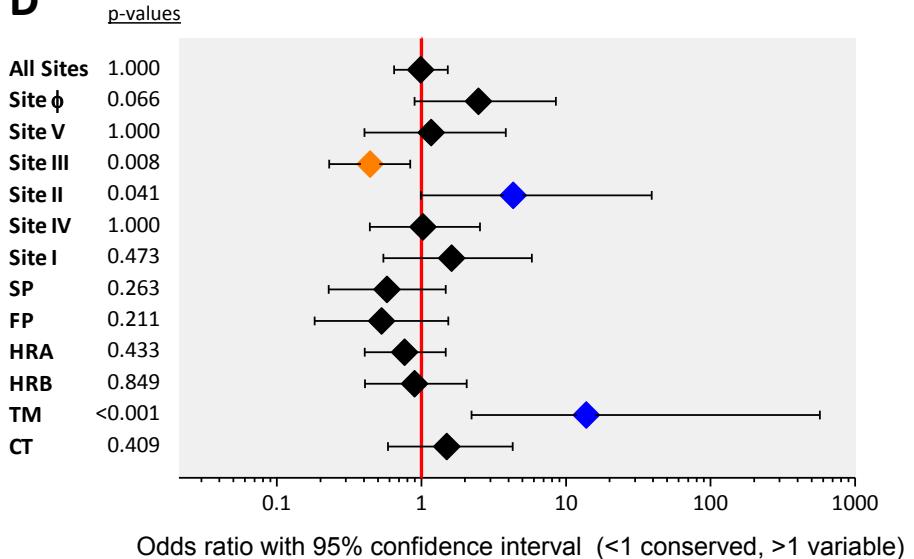

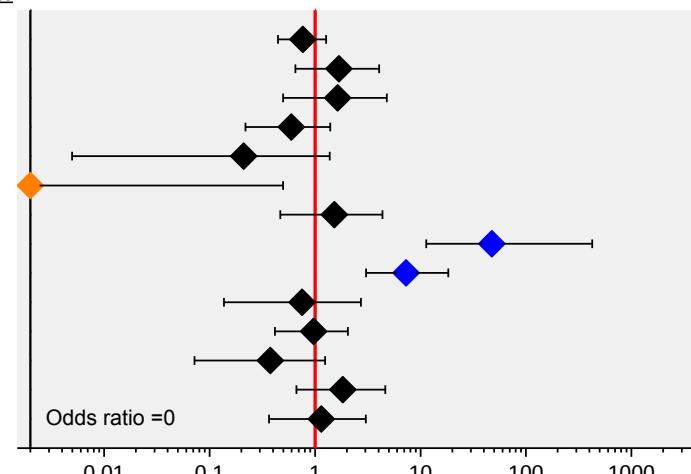

A**B****C****D**

Figure S3.- Probability of mutation in F regions and Ag Sites of hRSV group A (A), hRSV group B (B), bRSV (C) and hMPV (D) sequences using the Long strain as reference sequence. Results are shown as in Figure S2.

Table S1.- Amino acid sequence changes between A2 strain and hRSV group A F protein sequences: For each residue, the original and the new amino acid are shown at left and right between parenthesis, respectively. Residues in the left part of the Table correspond to those resolved in the 3D protein structure (3D+), indicating in different columns whether they have changed 1, 2, 3 or 4 times when all strains are considered. Residues in the right part of the Table and those not resolved in the 3D structure (3D-).
