^aModel 1: coefficient of the generalized linear multivariate model adjusted for sex, age, family purchasing power, diet quality index (Med-DQI), dietary iron intake and Physical Activity (PAQ-C)

^bModel 2: Model 1+ body mass index and C-reactive protein

^cExponentiated β coefficient: represents the relative change in geometric means with respect to Tertile 1. Expressed as a percentage and interpreted as the percentage change in the geometric mean.

^dHomeostatic Model Assessment–Insulin Resistance
