Summary

Background Up-to-date estimates of stroke burden and attributable risks and their trends at global, regional, and national levels are essential for evidence-based health care, prevention, and resource allocation planning. We aimed to provide such estimates for the period 1990–2021.

Methods We estimated incidence, prevalence, death, and disability-adjusted life-year (DALY) counts and age-standardised rates per 100 000 people per year for overall stroke, ischaemic stroke, intracerebral haemorrhage, and subarachnoid haemorrhage, for 204 countries and territories from 1990 to 2021. We also calculated burden of stroke attributable to 23 risk factors and six risk clusters (air pollution, tobacco smoking, behavioural, dietary, environmental, and metabolic risks) at the global and regional levels (21 GBD regions and Socio-demographic Index [SDI] quintiles), using the standard GBD methodology. 95% uncertainty intervals (UIs) for each individual future estimate were derived from the 2·5th and 97·5th percentiles of distributions generated from propagating 500 draws through the multistage computational pipeline.

Findings In 2021, stroke was the third most common GBD level 3 cause of death (7·3 million [95% UI 6·6–7·8] deaths; 10·7% [9·8–11·3] of all deaths) after ischaemic heart disease and COVID-19, and the fourth most common cause of DALYs (160·5 million [147·8–171·6] DALYs; 5·6% [5·0–6·1] of all DALYs). In 2021, there were 93·8 million (89·0–99·3) prevalent and 11·9 million (10·7–13·2) incident strokes. We found disparities in stroke burden and risk factors by GBD region, country or territory, and SDI, as well as a stagnation in the reduction of incidence from 2015 onwards, and even some increases in the stroke incidence, death, prevalence, and DALY rates in southeast Asia, east Asia, and Oceania, countries with lower SDI, and people younger than 70 years. Globally, ischaemic stroke constituted 65·3% (62·4–67·7), intracerebral haemorrhage constituted 28·8% (28·3–28·8), and subarachnoid haemorrhage constituted 5·8% (5·7–6·0) of incident strokes. There were substantial increases in DALYs attributable to high BMI (88·2% [53·4–117·7]), high ambient temperature (72·4% [51·1 to 179·5]), high fasting plasma glucose (32·1% [26·7–38·1]), diet high in sugar-sweetened beverages (23·4% [12·7–35·7]), low physical activity (11·3% [1·8–34·9]), high systolic blood pressure (6·7% [2·5–11·6]), lead exposure (6·5% [4·5–11·2]), and diet low in omega-6 polyunsaturated fatty acids (5·3% [0·5–10·5]).

Interpretation Stroke burden has increased from 1990 to 2021, and the contribution of several risk factors has also increased. Effective, accessible, and affordable measures to improve stroke surveillance, prevention (with the emphasis on blood pressure, lifestyle, and environmental factors), acute care, and rehabilitation need to be urgently implemented across all countries to reduce stroke burden.

Introduction

Evidence from the Global Burden of Disease, Injuries, and Risk Factors Study (GBD) suggests that prevalent cases of total cardiovascular disease (including stroke) nearly doubled from 271 million (95% uncertainty interval [UI] 257–285) in 1990 to 523 million (497–550) in 2019.[1] Moreover, despite a consistent decline in age-standardised cardiovascular disease (including stroke) mortality rates globally in the second half of the 20th century,[1] there has been a subsequent deceleration in the decline and an overall flattening of the decline in the past few years.[1] Since 2010, age-standardised cardiovascular disease (including stroke) mortality rates have even increased in many locations (eg, Mexico, the UK, and the USA),[1,2] and the age-standardised incidence of stroke in individuals younger than 55 years has increased substantially in high-income countries.[3,4] The previous GBD study on stroke burden and risks covered the period 1990–2019, and identified stroke as the second leading cause of death in the world.[5] The most recent GBD stroke burden project[6] has estimated an almost doubling of disability-adjusted life-years (DALYs),

Research in context

Evidence before this study

The Global Burden of Diseases, Injuries, and Risk Factors Study (GBD) is the only global epidemiological study that produces comprehensive estimates of global, regional, and country-specific burden due to stroke. To evaluate the availability of evidence, we carried out a structured review of the published scientific literature in MEDLINE, Scopus, Google Scholar, and PubMed for relevant reports published in any language from Jan 1, 1990, to March 1, 2024, using search terms that included "stroke", "cerebral infarction", "isch(a)emic stroke", "intracerebral h(a)emorrage", "h(a)emorrhagic stroke", or "subarachnoid h(a)emorrage", AND "incidence", "prevalence", "mortality", or "epidemiology" or "population attributable fraction (PAF)", "risk factor(s)", "trends", or "disability-adjusted life-year(s) (DALYs)". The most recent GBD report on the burden of stroke and its risk factors covered the period from 1990 to 2019 and found that the annual number of strokes and deaths due to stroke increased substantially, despite large reductions in age-standardised rates, particularly reductions among people aged 70 years or older. The highest age-standardised stroke-related mortality and DALY rates were in the World Bank low-income group, and the fastest growing risk factor for stroke between 1990 and 2019 was high BMI.

Added value of this study

As part of GBD 2021, this study provides the most up-to-date estimates of the burden of overall stroke, ischaemic stroke, intracerebral haemorrhage, and subarachnoid haemorrhage and its risk factors. We found that stroke burden, in terms of absolute numbers, has increased substantially from 1990 to 2021. From 1990 to 2021, there was an increase in the contribution to stroke DALYs from not only high BMI, as in the previous GBD 2019 study, but also high ambient temperature, high fasting plasma glucose, diet high in sugar-sweetened beverages, low physical activity, high systolic blood pressure, and diet low in omega-6 polyunsaturated fatty acids, emphasising the increasing role of environmental factors on the heightened burden from stroke. Stroke burden was highest in low-income and middle-income countries.

Implications of all the available evidence

The findings from this study can help to guide evidence-based health-care planning, prevention, and resource allocation for stroke and its pathological types, including country-specific prioritisation of these measures. Effective, accessible, and affordable measures to improve stroke surveillance, prevention (with the emphasis on elevated blood pressure, lifestyle, and environmental factors), acute care, and rehabilitation to reduce stroke burden need to be urgently implemented across all countries.

deaths, and cost due to stroke from 2020 to 2050.[6] Globally, the age-standardised prevalence of cardiovascular disease (including stroke) risk factors (including hypertension, overweight, and diabetes)[1] are also increasing.[7] There has been a rapid increase in the number of people who died or remained disabled from stroke over the past 30 years,[5] with a trend towards increasing incidence rates in people younger than 55 years, and increased prevalence of major risk factors for stroke (elevated blood pressure, overweight, and diabetes) over the past 10–15 years. These findings necessitate timely updated data on the most recent changes in stroke burden and risks across the globe to inform adequate health-care planning, resource allocation, and priority setting for stroke and to assess the success or failure of measures to reduce stroke burden.

See Online for appendix

The current GBD 2021 study of stroke burden and risks covers the period from 1990 to 2021. It includes analysis of the additional data sources for 2019–21, with corresponding re-calculation of all previous stroke burden and risks estimates, including stroke incidence, prevalence, deaths, and DALYs for total stroke and its three main pathological types (ischaemic stroke, intracerebral haemorrhage, and subarachnoid haemorrhage). It also includes analysis of DALYs due to stroke and stroke pathological type attributable to 23 risk factors and six risk factor clusters at global, regional, and national (204 countries and territories) levels. This manuscript was produced as part of the GBD Collaborator Network and in accordance with the GBD Protocol.

Methods

Overview

Details of the GBD 2021 methods for stroke burden and risk factors estimates remained the same as for the latest GBD estimates and are described elsewhere[8–10] (appendix pp 61–99). Stroke was defined according to the clinical WHO criteria[11] and categorised into three pathological types (ischaemic stroke, intracerebral haemorrhage, and subarachnoid haemorrhage).[12] To simplify the stroke modelling process and to ensure that all major pathological types were estimated correctly, vital registration and surveillance data were used to separately produce independent acute and chronic stroke models for ischaemic stroke, intracerebral haemorrhage, and subarachnoid haemorrhage type (appendix pp 75–76). As in previous GBD stroke burden estimates, we modelled first-ever-in-a-lifetime ischaemic stroke, intracerebral haemorrhage, and subarachnoid haemorrhage from the day of stroke onset to 28 days, and separately modelled survival (prevalence) beyond 28 days.[5]

Cause of Death Ensemble modelling (CODEm) was used to estimate deaths due to overall stroke and stroke pathological types. For non-fatal disease modelling (incidence and prevalence of stroke), we used the DisMod-MR 2.1 tool,[13] a Bayesian modelling software that uses data on various disease parameters and the epidemiological relationships between these parameters.[5] In the GBD study, the incidence rate represents new events in a given year, whereas the death rate represents those that occurred in that year regardless of when the stroke occurred.

We used data from 3736 vital registration sources, 147 verbal autopsy sources, 368 incidence sources, 346 prevalence sources, 229 excess mortality sources, 7753 risk factor exposure sources, and 2733 risk factor relative risk sources. Further details of the data sources used in this analysis are available on the GBD 2021 Sources Tool website.

Stroke incidence, mortality, prevalence, and DALY estimates are presented in absolute numbers and as age-standardised rates per 100 000 population (with 95% UIs) and are stratified by age, sex, 21 GBD regions, and seven GBD super-regions (appendix pp 202–203). Countries and territories were also grouped into quintiles of high, high-middle, middle, low-middle, and low Socio-demographic Index (SDI; a summary indicator of geometric mean of normalised values of a location's lag-distributed income per capita, the average years of schooling in the population aged 15 years or older, and the total fertility rate in females younger than 25 years),[14] on the basis of their 2021 values. Expressed on a scale from 0 to 1, a location with an SDI of 0 would have a theoretical minimum level of development relevant to health, whereas a location with an SDI of 1 would have a theoretical maximum level.

Count data in tables are rounded to the nearest thousand or, when the count is less than 1000, to the nearest 10. Uncertainty was propagated throughout all of these calculations by creating 500 values for each incidence, prevalence, death, or DALY estimate and performing aggregations across causes and locations at the level of each of the 500 values for all intermediate steps in the calculation. The lower and upper bounds of the 95% UI are the 2·5th and 97·5th percentiles.

Attributable burden of stroke due to risk factors

To analyse the attributable burden of stroke and its three pathological types due to 23 risk factors currently available for such analysis in GBD 2021, we calculated population attributable fractions (PAFs) of DALYs (appendix pp 31–43), using the exposure level for each risk factor and theoretical minimum risk exposure level (TMREL) that minimises risk for each individual in the population as the reference variable.[9] We analysed data on the prevalence of exposure to a risk and derived relative risks for any risk–outcome pair for which we found sufficient evidence of a causal relationship.[15] Adjustments for mediation were applied to account for relationships involving risk factors that act indirectly on outcomes via intermediate risks, as described elsewhere.[9] Relative risk data were pooled using meta-regression of cohort, case–control, or intervention studies. From the prevalence and relative risk results, PAFs were estimated relative to the TMREL. The PAF represents a proportion of the stroke DALYs that would be decreased if the exposure to the risk factor in the past had been at the counterfactual level of the TMREL.

The risks included in the analysis were ambient particulate matter pollution; household air pollution from solid fuels; low ambient temperature (daily temperatures below the TMREL); high ambient temperature (daily temperatures above the TMREL); lead exposure; diet high in sodium; diet high in red meat; diet high in processed meat; diet low in fruits; diet low in vegetables; diet low in wholegrains; alcohol use (any alcohol dosage consumption); diet high in sugar-sweetened beverages; diet low in fibre; diet low in omega-6 polyunsaturated fatty acids; low physical activity (only for ischaemic stroke burden); smoking; second-hand smoke; high BMI; high fasting plasma glucose; high systolic blood pressure; high LDL cholesterol (only for ischaemic stroke burden); and kidney dysfunction, as measured by low glomerular filtration rate (not assessed for subarachnoid haemorrhage burden). We set the TMREL to zero for all harmful dietary risk factors with monotonically increasing risk functions (eg, processed meat intake), excluding sodium. For protective risks with monotonically declining risk functions with exposure (eg, fruit intake), we first determined the 85th percentile of exposure in the cohorts or trials used in the meta-regression of each outcome that was associated with the risk. Then, we determined the TMREL by weighting each risk–outcome pair by the relative global magnitude of each outcome.[5]

As with causes, GBD organises risk factors into four levels, from the broadest (level 1: environmental risks, behavioural risks, and metabolic risks) to the most specific (level 4; 23 individual risk factors). The PAFs of risk factor groups took into account mediation between risk factors included in the group, as explained elsewhere.[16] Percentages and number of DALYs are not mutually exclusive. The crude sum of the PAF of the risk factors might exceed 100% because the effects of many of these risk factors are mediated partly or wholly through another risk factor or risk factors.[5] Definitions of risk factors and risk groups and further details of risk factors are in the appendix (pp 31–43). Changes in the modelling of stroke for GBD 2021 are presented in the appendix (pp 44–47). Analyses were also done by cluster of risk factors. The air pollution cluster includes ambient $PM_{2·5}$ pollution and household air pollution. The behavioural risks cluster includes smoking (including second-hand smoking), dietary risks (diet high in sodium, diet high in processed meat diet, high in red meat, diet high in sugar-sweetened beverages, diet low in omega-6 polyunsaturated fatty acids, diet low in

fruits, diet low in vegetables, and diet low in wholegrains), alcohol use, and low physical activity. The dietary risks cluster includes diet high in sodium, diet high in processed meat, diet high in red meat, diet high in sugar-sweetened beverages, diet low in omega-6 polyunsaturated fatty acids, diet low in fruits, diet low in vegetables, and diet low in wholegrains. The environmental risks cluster includes the air pollution cluster, low ambient temperature, high ambient temperature, and lead exposure. The metabolic risks cluster includes high fasting plasma glucose, high LDL cholesterol, high systolic blood pressure, high BMI, and kidney dysfunction. Finally, the tobacco smoke cluster includes smoking and second-hand smoking.

Role of the funding source

The funder of the study had no role in study design, data collection, data analysis, data interpretation, or the writing of the report.

Results

Stroke incidence, prevalence, death, and DALYs by geographical location

In 2021, there were 93·8 million (95% UI 89·0–99·3) stroke survivors, 11·9 million (10·7–13·2) new stroke events, 7·3 million (6·6–7·8) deaths from stroke, and 160·5 million (147·8–171·6) DALYs from stroke, comprising 10·7% (9·8–11·3) of all deaths and 5·6% (5·0–6·1) of all DALYs from all causes, the third leading cause of deaths (after ischaemic heart disease and COVID-19) and the fourth leading cause of DALYs (after COVID-19, ischaemic heart disease, and neonatal disorders; table 1; appendix p 204).

In 2021, 83·3% incident, 76·7% prevalent, and 87·2% fatal strokes, and 89·4% stroke-related DALYs occurred in all low-income and middle-income countries (LMICs) combined (appendix pp 48–49). We also observed geographical differences in age-standardised stroke incidence, with the lowest in Luxembourg (57·7 [95% UI 53·5–62·1] per 100 000) and highest in the Solomon Islands (355·0 [332·7–378·1] per 100 000); prevalence, with the highest in Ghana (2045·8 [1977·3–2120·1] per 100 000) and lowest in Cyprus (521·5 [495·7–553·5] per 100 000); deaths, with the lowest in Singapore (14·2 [12·3–15·6] per 100 000) and highest in North Macedonia (277·4 [235·5–321·2] per 100 000); and in DALY rates, with the lowest in Switzerland (333·3 [291·0–368·8] per 100 000) and highest in Nauru (6100·0 [4917·8–7576·1] per 100 000). Overall, the highest stroke burden (as measured by age-standardised incidence, prevalence, death, and DALY rates) in 2021 was observed in east Asia, central Asia, and sub-Saharan regions and lowest in high-income North America, Australasia, and Latin America regions, with the majority of the stroke burden in middle SDI, high-middle, and low-middle SDI regions (figure 1; appendix pp 50–85).

Burden by pathological type of stroke

Ischaemic stroke constituted the largest proportion of all incident strokes (7·8 million [95% UI 6·7–8·9], or 65·3% [62·4–67·7] of all strokes), followed by intracerebral haemorrhage (3·4 million [3·1–3·8] incident events, or 28·8% [28·3–28·8] of all strokes). However, the absolute number of DALYs due to intracerebral haemorrhage (79·5 million [72·7–85·2], or 49·6% [49·3–49·8] of total DALYs due to stroke) was greater than the number of DALYs due to ischaemic stroke (70·4 million [64·1–76·0], or 43·8% [43·5–44·3]). In 2021, subarachnoid haemorrhage occurred in 0·7 million (0·6–0·8) people (5·8% [5·7–6·0] of all strokes), and there were 10·6 million (9·4–12·1) DALYs due to subarachnoid haemorrhage (6·6% of DALYs from all strokes combined). Similar to total stroke, differences were observed for age-standardised rates for the three pathological types of stroke and their trends from 1990 to 2021 globally and by SDI (appendix pp 50–85, 208): rates of incident and fatal stroke were highest for ischaemic stroke (92·4 [79·8–105·8] per 100 000 and 44·2 [39·5–47·8] per 100 000, respectively) followed by intracerebral haemorrhage (40·8 [36·2–45·2] per 100 000 and 39·1 [35·4–42·6] per 100 000, respectively) and subarachnoid haemorrhage (8·3 [7·3–9·5] per 100 000 and 4·2 [3·7–4·8] per 100 000, respectively).

In 2021, there were large variations in the proportion of ischaemic stroke and intracerebral haemorrhage between high-income countries and LMICs (appendix pp 100–101). Whereas in high-income countries ischaemic stroke constituted 74·9% (95% UI 72·3–84·1) and intracerebral haemorrhage constituted 17·8% (17·3–17·9) of all incident strokes, in all LMICs combined these stroke subtypes constituted 63·4% (53·6–73·7) and 31·1% (30·2–31·3), respectively. Among all LMICs combined, the proportion of intracerebral haemorrhage was highest in low-income countries (36·9% [36·5–37·1]). The proportion of subarachnoid haemorrhage in high-income countries (7·3% [7·2–8·3]) was higher than that in all LMICs combined (5·5% [5·4–5·7]).

Trends in stroke burden by age, sex and geographical location

Among 11·9 million new strokes in 2021, 6·3 million (95% UI 5·6 to 7·0; or 52·6% [52·4 to 53·1]) occurred in males and 5·7 million (5·1 to 6·3; or 47·4% [47·3 to 47·6]) in females; the corresponding sex distribution of prevalent stroke was 51·0% (47·8 million [45·3 to 50·6]) for males and 49·0% (46·0 million [43·5 to 48·8]) for females; that for deaths from stroke was 52·1% (3·8 million [3·4 to 4·1]) for males and 47·9% (3·5 million [3·1 to 3·8] for females; and that for stroke-related DALYs was 55·0% (88·3 million [80·6 to 97·2]) for males and 45·0% (72·2 million [65·6 to 78·2) for females (table 1; appendix pp 138–139). From 1990 to 2021, the age-standardised incidence, prevalence, death, and DALY rates (table 1) of stroke and its pathological types were reduced virtually across all

Data in parentheses are 95% uncertainty intervals. Percentages and number of DALYs are not mutually exclusive. The sum of percentages and number of DALYs in the columns exceeds the totals for all risk factors combined because the effect of many of these risk factors are mediated partly or wholly through other risk factors. 0% represents very low numbers. DALYs=disability-adjusted life-years. *Air pollution cluster includes ambient $PM_{2·5}$ pollution and household air pollution. †Behavioural risks cluster includes smoking (including second-hand smoking), dietary risks (diet high in sodium, diet high in processed meat diet, high in red meat, diet high in sugar-sweetened beverages, diet low in omega-6 polyunsaturated fatty acids, diet low in fruits, diet low in vegetables, and diet low in wholegrains), alcohol use, and low physical activity. ‡Dietary risks cluster includes diet high in sodium, diet high in processed meat diet, high in red meat, diet high in sugar-sweetened beverages, diet low in omega-6 polyunsaturated fatty acids, diet low in fruits, diet low in vegetables, and diet low in whole grains. §Environmental risks cluster includes air pollution cluster, low ambient temperature, high ambient temperature, and lead exposure. ¶Metabolic risks cluster includes high fasting plasma glucose, high LDL cholesterol, high systolic blood pressure, high BMI, and kidney dysfunction. ‖Tobacco smoke includes smoking and second-hand smoking. **Age-standardised total percentage of DALYs due to all risk factors combined.

Table 2: **Stroke-related DALYs associated with risk factors and their clusters by World Bank country income level, for both sexes, 2021**

World Bank country income levels (except for ischaemic stroke incidence and prevalence in upper-middle-income countries, where the rates were increased by 1% [–4 to 5] for ischaemic stroke incidence and 11% [8 to 14] for ischaemic stroke prevalence). Although there was a trend towards lower age-standardised stroke burden rates (incidence, prevalence, deaths, and DALYs) across all quintiles of the SDI, there was a stagnation in the reduction of incidence rates from 2015 onwards, and even some increase in the prevalence rates in high-middle SDI countries from 2020 to 2021 (appendix p 209). Similar trend patterns were observed in seven GBD super-regions, with more prominent increases in age-standardised incidence and prevalence rates after 2015 in southeast Asia, east Asia, and Oceania (appendix p 206).

Although from 1990 to 2021 there was a decrease in the age-standardised incidence (–21·8% [95% UI–23·7 to –19·8]), prevalence (–8·5% [–9·7 to –7·3]), death (–39·4% [–44·0 to –34·6]), and DALY (–38·7% [–43·4 to –34·0]) stroke rates, increases were seen over that period in the numbers of people who had a new stroke (70·2% [65·9 to 74·6]), survived stroke (86·1% [83·0 to 89·4]), died from stroke (44·1% [32·3 to 56·0]), and who died or remained disabled from stroke (as measured by DALYs; 32·2% [21·7 to 42·7]; table 1; appendix pp 100–101). The percentage decline in age-standardised stroke incidence rates in the 2019–2021 period (–1·8% [–2·8 to –0·6]) was smaller than that for the overall 2010–21 period (–3·1% [–4·2 to –2·0]).

Although all-age (not age-standardised) stroke incidence, death, and DALY rates were substantially reduced in people aged 70 years or older between 1990 and 2021 (–18·2% [95% UI –21·3 to – 14·6] incidence rate, –34·2% [–39·4 to –29·3] death rate, and –35·6% [–40·2 to –30·8] DALY rate), and all-age prevalence rate in this age group did not change over this period (–1·0 [–3·1 to 1·2]), all-age incidence increased by 4·1% (0·9 to 7·6), prevalence increased in people younger than 70 years by 14·8% (13·1 to 16·8), and death and DALY rates were reduced in people younger than 70 years by 17·4% (–25·0 to –8·9) and 19·0% (–26·0 to –11·6), respectively (appendix p 140). Similar patterns were observed for all-age

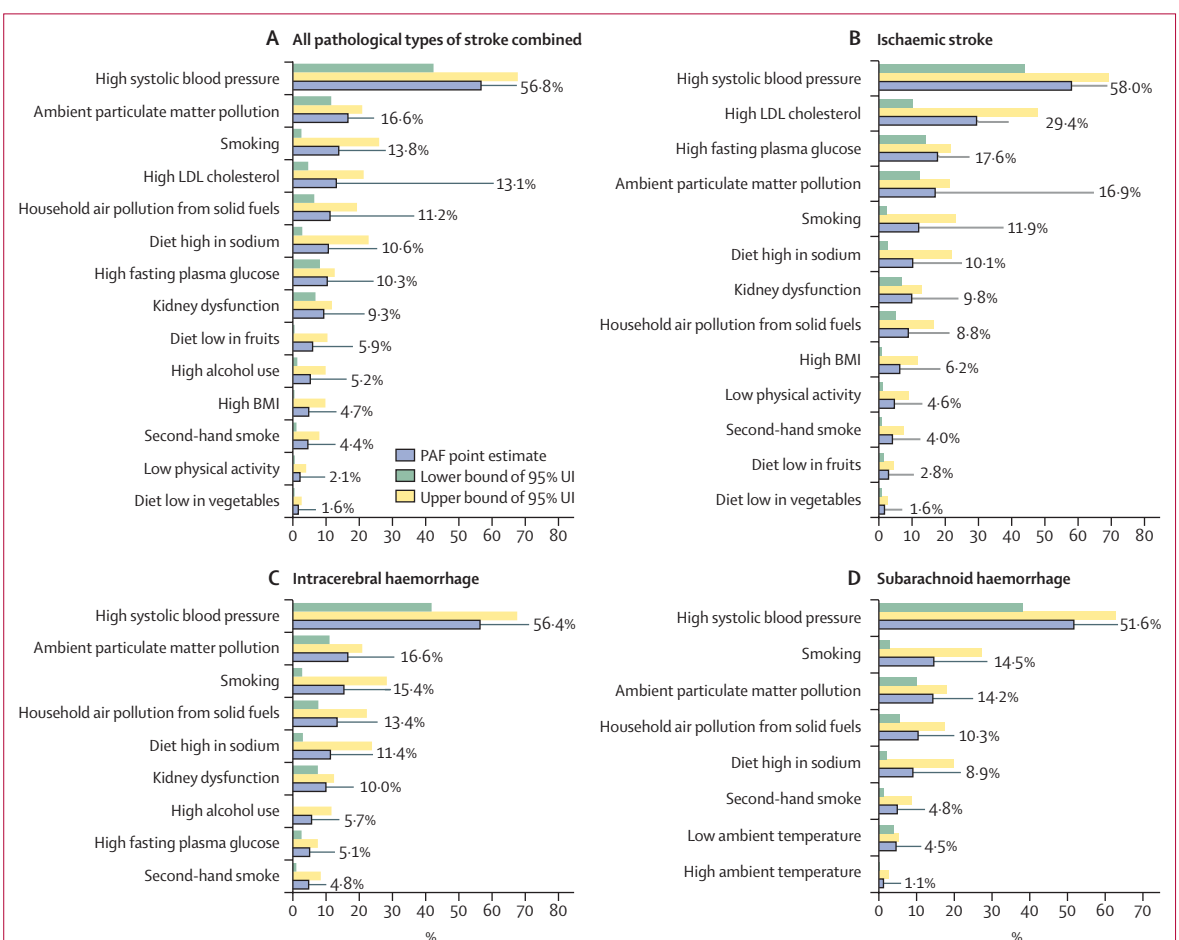

Figure 2: **Most individually significant risk factors for total stroke (A), ischaemic stroke (B), intracerebral haemorrhage (C), and subarachnoid haemorrhage (D), as measured by the PAF of stroke DALYs attributable to the risk factors, for both sexes**
DALYs=disability-adjusted life-years. PAF=population attributable fraction.

incidence, prevalence, death, and DALY rates of ischaemic stroke for both age groups (<70 years and ≥70 years). Of the three pathological types of stroke, only all-age subarachnoid haemorrhage prevalence rates increased in people younger than 70 years, by 3·4% (1·3 to 5·5), whereas all-age incidence, prevalence, death, and DALY rates of intracerebral haemorrhage and incidence, death, and DALY rates of subarachnoid haemorrhage were reduced in both age groups (appendix pp 88, 210–211).

Contribution of risk factors to stroke-related DALYs

Globally, the total number of stroke-related DALYs due to risk factors increased substantially from 1990 (100·1 million [95% UI 92·7 to 107·8]) to 2021 (135·0 million [122·0 to 147·7]), but there was no substantial change in the age-standardised stroke DALYs attributable to risk factors (–0·5% [–2·4 to 1·1]). In 2021, 84·1% (77·8 to 88·8) of DALYs from stroke were attributed to the 23 risk factors analysed (table 2), with the largest proportions of attributable risks for total stroke, ischaemic stroke, intracerebral haemorrhage, and subarachnoid haemorrhage observed in eastern Europe, Asia, and sub-Saharan Africa (appendix p 212).

At level 1 of the GBD risk factors hierarchy (table 2, appendix pp 141–253), metabolic risk factors contributed most to the stroke-related DALYs (range 66–70%) across all World Bank country income levels, followed by the environmental risk cluster in low-income, lower-middle-income, and upper-middle-income countries (range 35–53%), and behavioural risks (range 30–38%) across different income level countries. Stroke burden associated with the environmental or occupational risks was lowest in high-income countries (18·1% [95% UI 13·6 to 22·7]). Similarly, regions with higher SDI (appendix pp 141–143) had a larger contribution of metabolic and behavioural risks to stroke-related DALYs, whereas environmental risks most prominently contributed to stroke-related DALYs in lower SDI quintiles. From 1990 to 2021, the age-standardised proportion of stroke DALYs attributable to risk factors increased in north Africa and the Middle East (6·8% [4·1 to 11·5]) and sub-Saharan Africa (3·3% [1·8 to 5·3]), but did not change in south Asia (0·4% [–1·0 to 1·9]) and southeast Asia, east Asia, and Oceania (–0·9% [–4·2 to 1·9]), and decreased in central Europe, eastern Europe, and central Asia (–2·0% [–3·8 to –0·7]) and Latin America and the Caribbean (–5·0% [–9·1 to –2·3]), as well as high-income GBD regions (–7·3% [–10·1 to –5·0]).

Globally, of the 23 risk factors analysed, 14 individually significant risk factors for stroke were high systolic blood pressure (56·8% [95% UI 42·5–68·0] attributable DALYs), ambient particular matter (16·6% [11·5–20·9]), smoking (13·8% [2·5–26·0]), high LDL cholesterol (13·1% [4·6–21·3]), household air pollution (11·2% [6·4–19·3]), diet high in sodium (10·6% [2·8–22·8]), high fasting plasma glucose (10·3% [8·1–12·6]), kidney disfunction (9·3% [6·8–11·8]), diet low in fruits (5·9% [0·4–10·4]), high alcohol use (5·2% [1·3–9·8]), high BMI (4·7% [0·4–9·8]), second-hand smoking (4·4% [1·0–7·9]), low physical activity (2·1% [0·5–3·9]), and diet low in vegetables (1·6% [0·4–2·6]; figure 2).

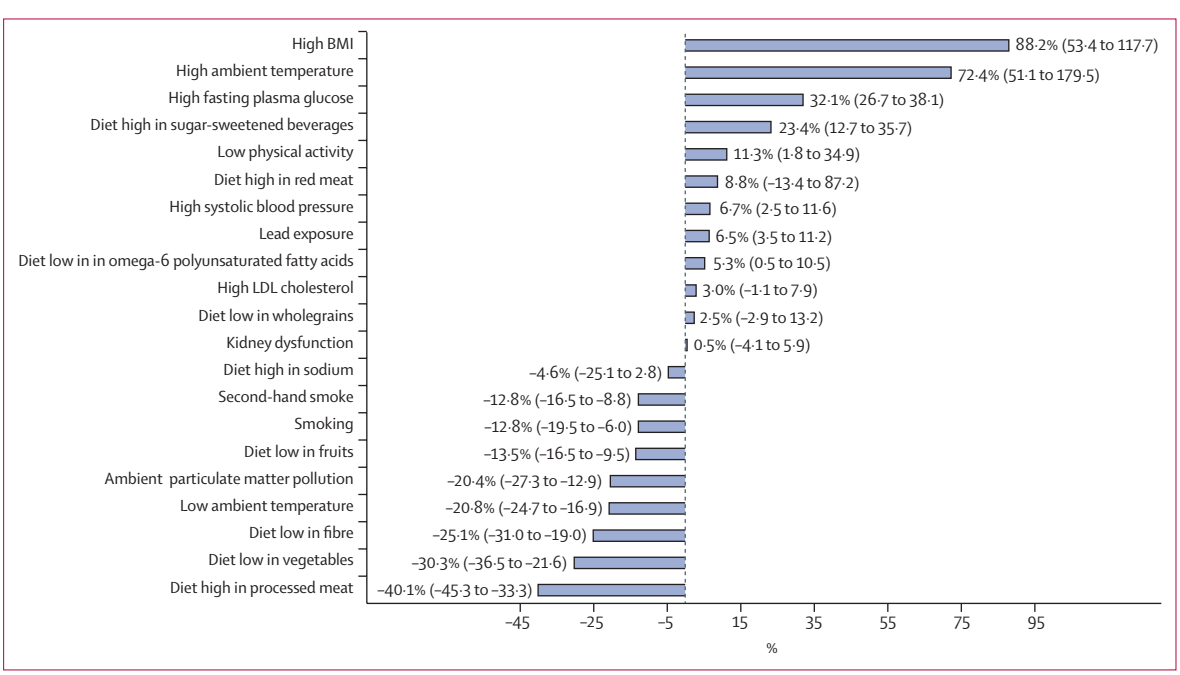

Figure 3: **Trends in the PAF of stroke DALYs due to risk factors, for both sexes, 1990–2021**
Data in parentheses are 95% uncertainty intervals. DALYs=disability-adjusted life-years. PAF=population attributable fraction.

Stroke attributable to metabolic risks constituted 68·8% (95% UI 57·6 to 77·5) of all strokes, environmental risks constituted 36·7% (29·0 to 44·2), and behavioural risks constituted 35·2% (26·9 to 44·7). Although the proportion of stroke DALYs attributable to metabolic risks increased from 1990 to 2021 by 6·7% (3·8 to 10·0; mainly because of the increase in the burden attributable to high BMI, high fasting plasma glucose, and high systolic blood pressure), proportions of stroke DALYs attributable to behavioural risks decreased by 8·0% (–13·6 to –3·4) and those due to environmental risks by 14·8% (–21·6 to –8·7), mainly because of the decrease in the burden attributable to diet high in processed meat, diet low in vegetables, diet low in fibre, low ambient temperature, particulate matter pollution, diet low in fruits, and smoking (figure 3). However, from 1990 to 2021, there was a substantial increase in the stroke DALYs attributable to high ambient temperature, high fasting plasma glucose, diet high in sugar-sweetened beverages, low physical activity, diet high in red meat, lead exposure, and diet low in omega-6 polyunsaturated fatty acids. There were noticeable geographical and regional variations in the PAF of the risk factors for ischaemic stroke, intracerebral haemorrhage, subarachnoid haemorrhage, and all stroke types combined (appendix p 264), as well as in the ranking of PAFs of age-standardised stroke DALYs attributable to risk factors by 21 GBD regions (figure 4). For the PAF of risk factors by pathological type of stroke, SDI, 21 GBD regions, and 204 countries and territories were used (appendix pp 89–201). Unlike the PAF of risk factors for total stroke, high alcohol use was not associated with ischaemic stroke-related DALYs (appendix pp 92–95, 126–149, 199), and diet low in fruits and vegetables and high BMI were not associated with intracerebral haemorrhage-related DALYs (appendix pp 92–95, 150–173, 200). Unlike ischaemic stroke and intracerebral haemorrhage, non-optimal ambient temperature appeared to be associated with the subarachnoid haemorrhage-related DALYs, with the greater contribution of low ambient temperature (4·5% [3·8 to 5·3]) than high ambient temperature (1·1% [0·2 to 2·5]). Other substantial risk factors for subarachnoid haemorrhage (appendix pp 151–153) were second-hand smoking (4·7% [3·2 to 6·2]), diet high in sodium (8·9% [2·0 to 19·8]), household air pollution from solid fuels (10·3% [5·5 to 17·4]), ambient particulate matter pollution (14·2% [9·8 to 18·0]), smoking (14·5% [2·7 to 27·2]), and high systolic blood pressure (51·6% [38·0 to 62·6]).

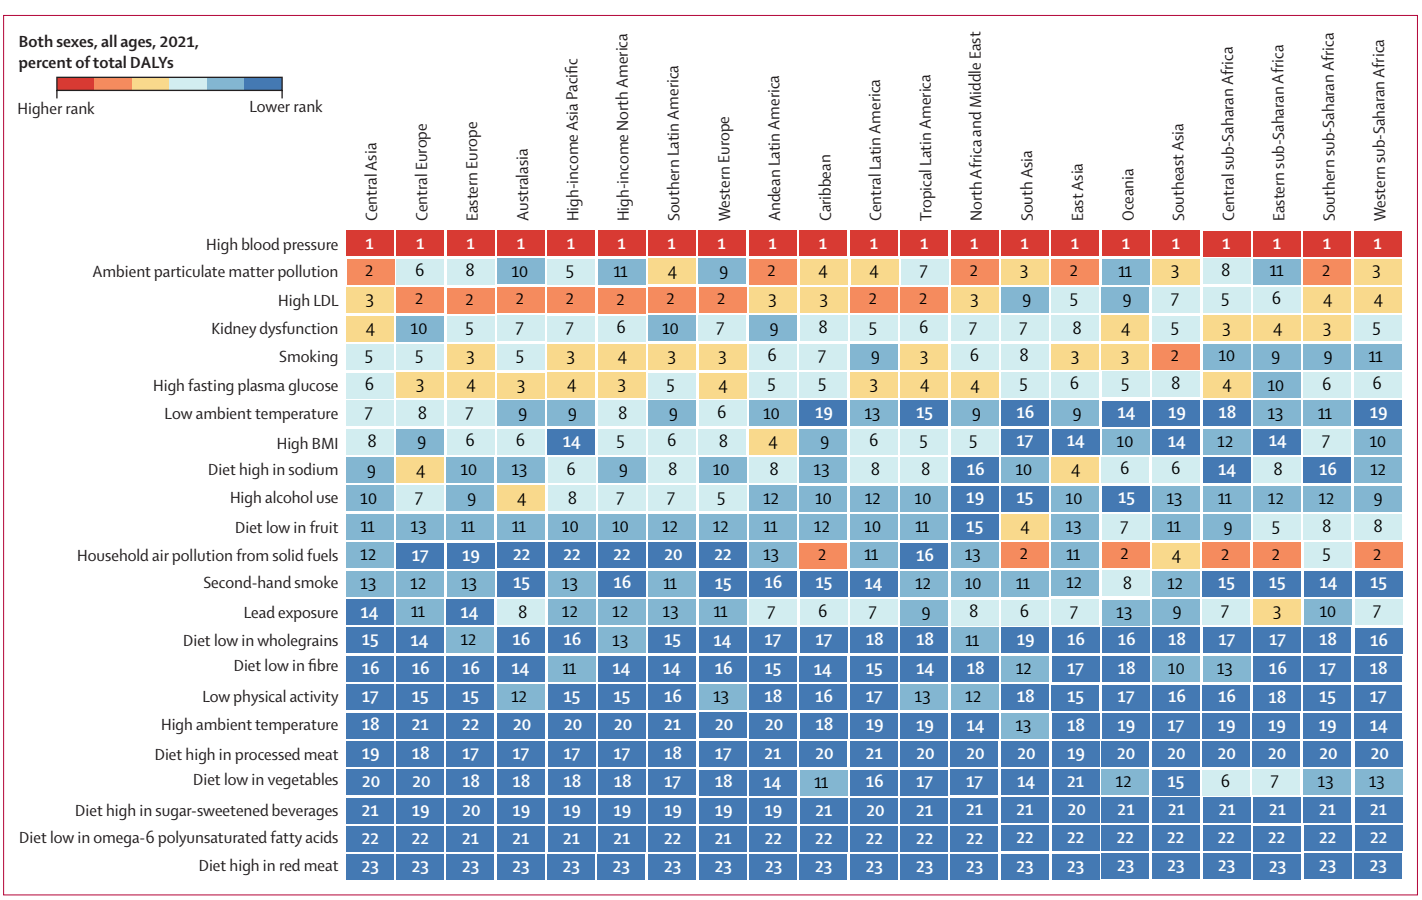

Figure 4: **Ranking of age-standardised stroke DALYs attributable to risk factors by 21 GBD regions, for both sexes, 2021**
DALYs=disability-adjusted life-years. GBD=Global Burden of Diseases, Injuries, and Risk Factors Study.

Discussion

In 2021, stroke remained the second most common cause (after ischaemic heart disease) of death and the third most common cause of DALYs (after ischaemic heart disease and neonatal disorders) among non-communicable disorders (NCDs) globally. However, at level 3 of the GBD all-cause hierarchy, stroke was the third most common cause of death (after ischaemic heart disease and COVID-19) and the fourth most common cause of DALYs (after COVID-19, ischaemic heart disease, and neonatal disorders), with the bulk of the stroke burden in LMICs and countries with lower SDI. Consistent with previous studies,[5,17] this study showed disparities in stroke burden (including almost two times greater proportion of intracerebral haemorrhage in LMICs than in high-income countries)[18] and risk factors by GBD region, country, country income level, and SDI quintiles, as well as an overall trend towards decreasing age-standardised stroke incidence, prevalence, and DALY rates from 1990 to 2021. Given the leading role of arterial hypertension in the occurrence of intracerebral haemorrhage,[19] the greater prevalence and poorer control of hypertension in LMICs[20] than in high-income countries are the most likely causes of the differences in the proportion of intracerebral haemorrhage in those countries. Similar proportions of subarachnoid haemorrhage in high-income countries and LMICs are likely to be related to the significant reduction in tobacco smoking prevalence that we observed since 2010 in high-income countries, with almost no change in tobacco smoking prevalence in LMICs.[21] However, the current study documented a stagnation in the reduction of age-standardised incidence rates from 2015 onwards, and even some increase in the age-standardised stroke incidence, death, prevalence, and DALY rates in southeast Asia, east Asia, and Oceania, and countries with lower SDI from 2015 onwards. Globally, there was also an increase in all-age incidence and prevalence rates in people younger than 70 years, whereas there was a reduction in all-age stroke incidence, prevalence, death, and DALY rates in people aged 70 years or older. A trend towards increasing incidence and prevalence rate of cardiovascular diseases (including stroke) in people aged 15–39 years globally[22] and stroke incidence rates in people younger than 55 years[3] versus older people has also been shown in previous systematic reviews and is likely to be related to the increase in prevalence of arterial hypertension[23,24] (including poorly controlled and uncontrolled hypertension),[25] overweight or obesity,[26–28] and type 2 diabetes[29] in young adults, especially in LMICs.[24,26–29] This situation is complicated by the fact that a large proportion of young adults with vascular risk factors, arterial hypertension,[30] and dyslipidaemia[31] remain under-treated owing at least partly to the widespread use of absolute cardiovascular disease risk[32] treatment thresholds.[3] The observed slowing down of the percentage of decline of age-standardised stroke incidence rates in 2019–21 is likely to be related to the decreased hospital admissions of patients with acute stroke that was observed over the COVID-19 period in many countries.[33]

Apart from population growth and ageing,[1,34] other factors responsible for the increased burden of stroke, in terms of absolute numbers in the world, are likely to be related to the insufficient effectiveness of the currently used primary stroke and cardiovascular disease prevention strategies[35,36] as well as the disparities and major gaps in stroke service provision and accessibility, and workforce of stroke care providers in many countries (especially LMICs).[17,37,38] Although stroke is highly preventable, globally there were substantial increases in DALYs attributable to high BMI, high ambient temperature, high fasting plasma glucose, diet high in sugar-sweetened beverages, low physical activity, high systolic blood pressure, and diet low in polyunsaturated omega-6 fatty acids, suggesting the growing role of these environmental and behavioural risks in the stroke burden. However, from 1990 to 2021, we also observed a reduction of PAF due to diet high in processed meat, diet low in vegetables, diet low in fibre, low ambient temperature, ambient particulate matter pollution, diet low in fruits, and smoking, suggesting effectiveness of the strategies towards reduction of the exposure to these risk factors. The observed increase in the age-standardised proportion of stroke DALYs attributable to risk factors in north Africa and the Middle East and sub-Saharan Africa regions might reflect a failure in the control of stroke risk factors. However, in central Europe, eastern Europe, central Asia, Latin America and the Caribbean, and high-income GBD regions, this might reflect a success in the control of stroke risk factors.

This study is, to our knowledge, the first to show the large contribution of ambient particulate matter pollution and household air pollution from solid fuels to subarachnoid haemorrhage DALYs, with a similar PAF to that of smoking. A close relationship between ambient air pollution and subarachnoid haemorrhage mortality was found in some studies.[39–41] Air pollution in 2021 appeared to be highly important to other types of stroke and also caused 11·9% (95% UI 10·0–13·8) of total deaths from all causes, making it the second largest cause of deaths from all causes globally (after high systolic blood pressure) and the second leading cause of DALYs (8·2% [6·9–9·6]) from all causes (after malnutrition).[42] These findings are in line with research showing that rises in ambient temperature (including heatwaves) and climate change are associated with increased stroke morbidity and mortality.[43,44] Because ambient air pollution is reciprocally associated with the ambient temperature and climate change,[44] all of which synergistically influence cardiovascular disease (including stroke) occurrence[44–46] and overall health,[47,48] the importance of urgent climate actions and measures to reduce ambient air pollution cannot be

overestimated.[47,48] Experts have recommended that governments increase implementation of a clean-energy economy, promote unprocessed plant-based food choices,[44] and globally phase out industrialised animal farming.[49]

Every member state of the UN has committed to meeting the Sustainable Development Goals (SDGs), but currently few countries are on target to achieve SDG 3.4, which is to reduce by a third premature mortality from NCDs through prevention and treatment and promote mental health and wellbeing by 2030. By implementing and monitoring the World Stroke Organization–*Lancet Neurology* Commission's recommendations,[38] the global burden of stroke would be reduced drastically this decade and beyond. Not only would this substantial reduction enable SDG 3.4, as well as other key SDGs, to be met, it would improve brain health and the overall wellbeing of millions of people across the globe. One of the most common problems in implementing stroke prevention and care recommendations is the scarcity of funding. The World Stroke Organization–*Lancet Neurology* Commission on stroke[38] recommends introducing legislative regulations and taxation of unhealthy products by each government in the world. Such taxation would not only reduce consumption of these products and, therefore, lead to the reduction of burden from stroke and other major NCDs,[50–52] but also generate a large revenue[50] sufficient to fund prevention programmes and services for stroke and other major disorders, reduce poverty and inequality in health service provision, improve wellbeing of the population, and boost local economies.

The main strength of this study is the extended number of data sources included in the analysis that allowed us to generate more accurate and up-to-date stroke burden and risk factor estimates. This allows evidence-based health-care planning and resource allocation by health policy makers on the national, regional, and global levels. However, good-quality stroke epidemiological studies[7] are still scarce in most countries, which prevented us from including in the analysis many other important risk factors, such as sickle cell disease and HIV, which are particularly important for sub-Saharan Africa. Differences in health-care systems and completeness and accuracy of stroke case ascertainment might play a part in the observed between-country differences (eg, very high stroke prevalence in Ghana compared with neighbouring countries). Although the GBD methods for estimating attributable burden of stroke due to risk factors accounts for a cumulative effect of multiple risk factors, it might not fully account for all potential confounders. Moreover, some new risk factors, such as high ambient temperature, might require further validation and examination to confirm their impact on stroke burden. Furthermore, more granular data analysis is needed. For example, stroke burden variation by race and ethnicity within countries, which can mask disparities in stroke incidence, risk factors, and outcomes among different population groups, and analysis of attributable effects of different levels of exposure to smoking, alcohol, and so on. We expect such analysis will be done in future GBD iterations.

In summary, our study findings continue to point out that currently used stroke prevention strategies are not sufficiently effective to halt, let alone reduce, the fast-growing stroke burden. Additional, more effective stroke prevention strategies (with the emphasis on population-wide measures, task shifting from doctors to nurses or health volunteers, and the wider use of evidence-based mobile and telehealth platforms) and pragmatic solutions to address the critical gaps in stroke service delivery, along with development of context-appropriate workforce capacity building and epidemiological surveillance systems,[38] need to be urgently implemented across all countries. Without scaling up these innovative evidence-based strategies and policies that target local, national, regional, and global stroke prevention and care disparities, the burden of stroke will continue to grow, thus threatening the sustainability of health systems worldwide.

*Senior authors.
Please see the appendix (pp 10–47) for the affiliations of individual authors.

Contributors

For individual authors' contributions to the manuscript, please see the appendix (pp 47–61), divided into the following categories: managing the overall research enterprise; writing the first draft of the manuscript; primary responsibility for applying analytical methods to produce estimates; primary responsibility for seeking, cataloguing, extracting, or cleaning data; designing or coding figures and tables; providing data or critical feedback on data sources; developing methods or computational machinery; providing critical feedback on methods or results; drafting the manuscript or revising it critically for important intellectual content; and managing the estimation or publications process. The corresponding and senior authors had full access to the data in the study and had final responsibility for the decision to submit for publication. V L Feigin, C O Johnson, G A Roth, C Bisignano, T Vos, and C J L Murray had full access to and verified data.

Declaration of interests

A Abdelalim reports a leadership or fiduciary role in the Middle East and North Africa Stroke Organization, unpaid, as Vice President, outside the

submitted work. S Afzal reports support for the present manuscript from King Edward Medical University through the provision of study material, research articles, valid data sources and authentic real time information for this manuscript; payment or honoraria for educational events and webinars with King Edward Medical University and collaborative partners including University of Johns Hopkins, University of California, University of Massachusetts, KEMCAANA, and KEMCA_UK; participation on a Data Safety Monitoring Board or Advisory Board with the National Bioethics Committee Pakistan, the King Edward Medical University Ethical Review Board, the Ethical Review Board of Fatima Jinnah Medical University and Sir Ganga Ram Hospital, and being a member of the Technical Working Group on Infectious Diseases; other financial and non-financial interests in King Edward Medical University, Annals of King Edward Medical University, Quality Enhancement Cell King Edward Medical University, Faculty of Public Health United Kingdom, Scientific Session, KEMCA-UK, International Scientific Conference, KEMCAANA, Research and Publications Higher Education Commission Pakistan, Research and Journals Committee Pakistan, Medical and Dental Council Pakistan, National Bioethics Committee Pakistan, Corona Experts Advisory Group, Technical Working Group on Infectious Diseases, Dengue Experts Advisory Group, Punjab Residency Program Research Committee, all outside the submitted work. R Akinyemi reports grants U19AG074865, U19 AG076581and R01AG072547 from the US National Institutes of Health/National Institute of Aging, GBHI ALZ UK-21- 24204 from the Alzheimer's Association and the Global Brain Health Institute, UK Royal Society/African Academy of Sciences FLAIR Grants FLR/R1/191813 and FCG/R1/201034, and GCRF Networking Grant from the UK Academy of Medical Sciences, all outside the submitted work. A Al-Ibraheem reports grants or contracts and support for attending meetings and/or travel from King Hussein Cancer Center, International Atomic Energy Agency; consulting fees from University of Jordan; leadership or fiduciary role, paid or unpaid, with Arab Society of Nuclear Medicine, and Asia Oceania Federation of Nuclear medicine and biology; all outside the submitted work. R Ancuceanu reports payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from AbbVie, Laropharm, and Reckitt, outside the submitted work. J Ärnlöv reports payment or honoraria for lectures from AstraZeneca and Novartis; participation on an Advisory Board with AstraZeneca and Astella; all outside the submitted work. M Ausloos reports grants or contracts from the project "A better understanding of socio-economic systems using quantitative methods from Physics" funded by European Union – NextgenerationEU and Romanian Government, under National Recovery and Resilience Plan for Romania, contract no.760034/ 23.05.2023, cod PNRR-C9-I8-CF 255/29.11.2022, through the Romanian Ministry of Research, Innovation and Digitalization, within Component 9, Investment I8, outside the submitted work. O C Baltatu reports grants or contracts from National Council for Scientific and Technological Development (CNPq, 304224/2022-7) and the Anima Institute through an AI research professor fellowship; leadership or fiduciary role, paid or unpaid, with Health and Biotechnology Advisory Board at Technology Park São José dos Campos – Center for Innovation in Health Technologies (CITS), outside the submitted work. T W Bärnighausen reports grants or contracts from National Institutes of Health, Alexander von Humboldt Foundation, German National Research Foundation (DFG), European Union, German Ministry of Education and Research, German Ministry of the Environment, Wellcome, and KfW; payment or honoraria for serving as Editor-in-Chief of PLOS Medicine; participation on a Data Safety Monitoring Board or Advisory Board, unpaid, with NIH-funded research projects in Africa on Climate Change and Health; stocks in CHEERS, an SME focusing on approaches to measure climate change and health-related variables in population cohorts; all outside the submitted work. S Bhaskar reports grants or contracts from Japan Society for the Promotion of Science (JSPS), Japanese Ministry of Education, Culture, Sports, Science and Technology (MEXT) through Grant-in-Aid for Scientific Research (KAKENHI), and from JSPS and the Australian Academy of Science through the JSPS International Fellowship; leadership or fiduciary role, paid or unpaid, with National Cerebral and Cardiovascular Center, Suita, Osaka, Japan, NSW Brain Clot Bank, Sydney, Australia, Rotary District 9675, Sydney, NSW, Australia, Global Health & Migration Hub Community, Global Health Hub Germany, Berlin, Germany, PLOS One, BMC Neurology, Frontiers in Neurology, Frontiers in Stroke, Frontiers in Aging, Frontiers in Public Health & BMC Medical Research Methodology, College of Reviewers, Canadian Institutes of Health Research (CIHR), Government of Canada, Cardiff University Biobank, Cardiff, UK, Cariplo Foundation, Milan, Italy, Pandemic Health System REsilience PROGRAM (REPROGRAM) Consortium; all outside the submitted work. B Bikbov reports grants or contracts with European Commission, Politecnico di Milano, and University of Rome; support for attending meetings and/or travel from European Renal Association; leadership or fiduciary role, unpaid, with Advocacy Group, International Society of Nephrology and Western Europe Regional Board, International Society of Nephrology; other non-financial in Scientific-Tools.org; all outside the submitted work. A Biswas reports consulting fees from Lupin Pharmaceuticals India, Intas Pharmaceuticals India, Alkem Laboratories India, and Eisai Pharmaceuticals India, all outside the submitted work. E J Boyko reports Payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from Korean Diabetes Association, Diabetes Association of the R.O.C. (Taiwan), American Diabetes Association, and the International Society for the Diabetic Foot; support for attending meetings and/or travel from Korean Diabetes Association, Diabetes Association of the R.O.C. (Taiwan), and International Society for the Diabetic Foot; all outside the submitted work. A L Catapano reports grants or contracts from Amryt Pharma, Menarini, and Ultragenyx; payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from Amarin, Amgen, Amryt Pharma, AstraZeneca, Daiichi Sankyo Esperion Ionis Pharmaceutical Medscaper, Menarini, Merck, Novartis, NovoNordisk, Peervoice Pfizer Recordati Regeneron, Sandoz, Sanofi The Corpus, Ultragenyx, and Viatris; all outside the submitted work. S Das reports a leadership or fiduciary role, unpaid, with association of Diagnostic & Laboratory Medicine India Chapter and Women in Global Health India, outside the submitted work. A Demetriades reports Leadership or fiduciary role, paid or unpaid as the Immediate Past President, European Association of Neurosurgical Societies (EANS) and Vice-President, Global Neuro Foundation, outside the submitted work. A Faro reports support for the present manuscript from National Council for Scientific and Technological Development (CNPq) through a scholarship. M Foschi reports consulting fees from Novartis and Roche; support for attending meetings and/or travel from Roche, Novartis, Biogen, Bristol-Meyer, Merck, and Sanofi; leadership or fiduciary role with MSBase Foundation as a member of the scientific leadership group; all outside the submitted work. R Franklin reports support for attending meetings and/or travel from ACTM – Tropical Medicine and Travel Medicine Conference 2022, 2023 and ISTM – Travel Medicine Conference, Basel 2023; leadership or fiduciary role, paid or unpaid, as Director of Kidsafe, Director of Auschem, Governance Committee of ISASH, Director of Farmsafe, SIG Convenor of PHAA Injury Prevention, and Vice President of ACTM; all outside the submitted work. A Guha reports grants or contracts from American Heart Association and Department of Defense; consulting fees from Pfizer and Novartis; leadership or fiduciary role, paid or unpaid, with ZERO Prostate Cancer – health equity task force; all outside the submitted work. G J Hankey reports payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from American Heart Association (for serving as Associate Editor of Circulation) Janssen (Johnson & Johnson) (for serving as Co-chair of Executive Committee, Librexia Stroke Trial, and lectures at sponsored scientific symposia), outside the submitted work. N E Ismail reports leadership or fiduciary role, unpaid, with Malaysian Academy of Pharmacy, Malaysia, and Malaysian Pharmacists Society Education Chapter, Malaysia, all outside the submitted work. T Joo reports support for the present manuscript from National Research, Development and Innovation Office in Hungary (RRF-2.3.1-21-2022-00006, Data-Driven Health Division of National Laboratory for Health Security) for funding of participation in the research project. J J Jozwiak reports Payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from Novartis, ADAMED, and Amgen; outside the submitted work. K Krishan reports non-financial support from the UGC Centre of Advanced Study, CAS II, awarded to the

Department of Anthropology, Panjab University, Chandigarh, India, outside the submitted work. B Lacey reports support for the present manuscript from UK Biobank, funded largely by the UK Medical Research Council and Wellcome. P M Lavados reports grants from Boehringer Ingelheim; consulting fees from Boehringer Ingelheim for LATAM Stroke Projects Mentorship; payment or honoraria for lectures from Boehringer Ingelheim, Ferrer, Pfizer, and Novartis; support for attending Southamerican Angels meetings from Boehringer Ingelheim; participation on a Data Safety Monitoring Board or Advisory Board with Janssen, BMS, and Pfizer; leadership or fiduciary role, paid or unpaid, with Chilean Stroke Association (ACEVE) and Iberoamerican Stroke Society (SIECV-IASO); all outside the submitted work. M Li reports grants or contracts from the National Science and Technology Council, Taiwan (NSTC 112-2410-H-003-031; leadership or fiduciary role, paid or unpaid, as Technical Editor, Journal of the American Heart Association; all outside the submitted work. D Lindholm reports previous stock options and other financial or non-financial interests in AstraZeneca as a former employee, outside the submitted work. W Lo report stock or stock options in Abbott Lab, Amgen, Becton Dickson, Bristol Myers Squibb, Cardinal Health, GE Healthcare, Illumina, McKesson, Merck, Moderna, Pfizer, and Walgreens Boots, outside the submitted work. S Lorkowski reports grants or contracts from dsm-firmenich (formerly DSM Nutritional Products) as payments to their institution; consulting fees from Danone, Novartis Pharma, and Swedish Orphan Biovitrum (SOBI); payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from AMARIN Germany, Amedes Holding, Amgen, Berlin-Chemie, Boehringer Ingelheim Pharma, Daiichi Sankyo Deutschland, Danone, Hubert Burda Media Holding, Janssen-Cilag, Lilly Deutschland, Novartis Pharma, Novo Nordisk Pharma, Roche Pharma, Sanofi-Aventis, Swedish Orphan Biovitrum (SOBI), SYNLAB Holding Deutschland; support for attending meetings and/or travel from AMGEN; participation on a Data Safety Monitoring Board or Advisory Board from AMGEN, Daiichi Sankyo Deutschland, Novartis Pharma, Sanofi-Aventis; all outside the submitted work. L G Manotvani reports support for the present manuscript from the Italian Ministry of Health, Ministero della Salute, Ricerca Corrente, IRCCS Istituto Auxologico Italiano.H R Marateb reports support for their participation in present manuscript from Beatriu de Pinós post-doctoral programme from the Office of the Secretary of Universities and Research from the Ministry of Business and Knowledge of the Government of Catalonia programme: (2020 BP 00261). S Meo reports grants or contracts from Researchers Supporting Project, King Saud University, Riyadh, Saudi Arabia (RSP-2024 R47), outside the submitted work. L Monasta reports support for the present manuscript from the Italian Ministry of Health (Ricerca Corrente 34/2017), payments made to the Institute for Maternal and Child Health IRCCS Burlo Garofolo. R Moreira reports grants or contracts from CNPq (National Council for Scientific and Technological Development, scholarship registration number 316607/2021-5) outside the submitted work. S Muthu reports receiving the Luiz Vialle Award 2024 for travel support to attend Global Spine Congress 2024 from AO Spine International; leadership or fiduciary role with SICOT Awards Committee, AO Spine Associate Knowledge Forum, ICRS Next-Gen Committee; all outside the submitted work. S Nomura reports grants from Ministry of Education, Culture, Sports, Science and Technology of Japan (21H03203), and Precursory Research for Embryonic Science and Technology from the Japan Science and Technology Agency (JPMJPR22R8); outside the submitted work. B Norrving reports participation on a data safety or monitoring board or advisory board with Simbec-Orion (HOVID Trial); outside the submitted work. A Oneil reports grants or contracts from the National Health and Medical Research Council via her institution (#2009295); payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from the Exercise & Sports Science Australia conference for an invited presentation; outside the submitted work. A P Okekunle reports support for the present manuscript from National Research Foundation of Korea funded by the Ministry of Science and ICT (2020H1D3A1A04081265); support for attending meetings and/or travel from National Research Foundation of Korea funded by the Ministry of Science and ICT (2020H1D3A1A04081265); all outside the submitted work. R Ornello reports institutional grants from Novartis, consulting fees from Teva; payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from Eli Lilly, Novartis, Pfizer, Teva, AbbVie, and Lundbeck; support for attending meetings or travel from Teva; participation on a Data Safety Monitoring Board or Advisory Board with Eli Lilly; leadership or fiduciary role with The Journal of Headache and Pain Editorial Board, and Frontiers in Neurology Headache and Neurogenic Pain Section; receipt of payment of publication fees from Novartis and AbbVie; all outside the submitted work. A Ortiz reports grants to their institute from Sanofi and Catedra Mundipharma-UAM of diabetic kidney disease and the Catedra AstraZeneca-UAM of chronic kidney disease and electrolytes; consultancy or speaker fees Advicciene , Astellas, AstraZeneca, Amicus, Amgen, Boehringer-Ingelheim, Fresenius Medical Care, GSK, Bayer, Sanofi-Genzyme, Menarini, Kyowa Kirin, Alexion, Idorsia, Chiesi, Otsuka, Novo-Nordisk and Vifor Fresenius Medical Care Renal Pharma; travel support from Advicciene , Astellas, AstraZeneca, Fresenius Medical Care, Boehringer-Ingelheim Bayer, Sanofi-Genzyme, Menarini, Chiesi, Otsuka, Sysmex; leadership or fiduciary role, unpaid, with Council ERA. SOMANE; all outside the submitted work. E Ortiz-Prado reports grants or contracts from Universidad de las Americas, Quito-Ecuador outside the submitted work. R Palma-Alvarez reports payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from Angelini, Casen Recordarti, Lundbeck, Rubió, Takeda, Servier, and Neuraxpharm; support for attending meetings or travel from Angelini, Casen Recordati, Takeda, Italfarmaco, Lundbeck, and Janssen; all outside the submitted work. R Passera reports participation on Data Safety Monitoring Board dello studio "Consolidation with ADCT-402 (loncastuximab tesirine) after immunochemotherapy: a phase II study in BTKi-treated/ineligible Relapse/Refractory Mantle Cell Lymphoma (MCL) patients" - FIL, Fondazione Italiana Linfomi, Alessandria; leadership or fiduciary role, unpaid, as a Member of the EBMT Statistical Committee, European Society for Blood and Marrow Transplantation, Paris (F), and Past member 2020-2023 (biostatistician) of the IRB/IEC Comitato Etico AO SS. Antonio e Biagio Alessandria-ASL AL-VC; all outside the submitted work. A E Peden reports support for the present manuscript from [Australian] National Health and Medical Research Council (Grant Number: APP2009306). A Rane reports being a full-time employee of Agios Pharmaceuticals and owning stock and stock options, outside the submitted work. S Sacco reports grants or contracts from Novartis and Uriach; consulting fees from Novartis, Allergan-AbbVie, Teva, Lilly, Lundbeck, Pfizer, NovoNordisk, Abbott, and AstraZeneca; payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from Novartis, Allergan-Abbvie, Teva, Lilly, Lundbeck, Pfizer, NovoNordisk, Abbott, AstraZeneca; support for attending meetings and/or travel Lilly, Novartis, Teva, Lundbeck, and Pfizer; leadership or fiduciary role in other board, society, committee or advocacy group, paid or unpaid, with President European Stroke Organisation, and as Editor-in-Chief Cephalalgia; receipt of equipment, materials, drugs, medical writing, gifts or other services from Allergan-AbbVie, NovoNordisk; all outside the submitted work. Y L Samodra reports grants or contracts from FK Unpar, Indonesia; leadership or fiduciary role in other board, society, committee or advocacy group, paid or unpaid, with Benang Merah Research Center, Indonesia; all outside the submitted work. J Sanabria reports support for attending meetings and/or travel from Continuous Medical Education (CME) funds from Marshall University School of Medicine; participation on a Data Safety Monitoring Board or Advisory Board with Quality officer for the Department of Surgery; leadership or fiduciary role in other board, society, committee or advocacy group, paid or unpaid, with SSAT, ACS, IHPBA, American Board of Surgery; all outside the submitted work. N Scarmeas reports grants or contracts from Novo Nordisk through funding to their institution; participation on a Data Safety Monitoring Board or Advisory Board with the Multicultural Healthy Diet to Reduce Cognitive Decline & AD Risk NIH Funded Study at Albert Einstein College of Medicine, and with Primus AD through a Public Private funded Phase II study in Germany; all outside the submitted work. B M Schaarschmidt reports grants from Else Kröner-Fresenius Foundation, Deutsche Forschungsgemeinschaft, and PharmaCept; payment or honoraria for lectures from AstraZeneca; support for travel from Bayer AG; all outside the submitted work. A E Schutte reports

grants or contracts from National Health and Medical Research Council of Australia, and the Medical Research Future Fund, Australia; consulting fees from Skylabs, Abbott, and Servier; payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from Abbott, Servier, Sanofi, Omron, Medtronic, and Aktiia; support for attending meetings or travel from Medtronic and Servier; leadership or fiduciary role, paid or unpaid, as Co-Chair National Hypertension Taskforce of Australia; all outside the submitted work. A Sharifan reports Leadership or fiduciary role, unpaid, with Cochrane Early Career Professionals Network; receipt of equipment, materials, drugs, medical writing, gifts or other services from Elsevier and Cochrane; all outside the submitted work. V Sharma reports other financial or non-financial interests in DFSS (MHA)'s research project (DFSS28(1)2019/EMR/6) at Institute of Forensic Science & Criminology, Panjab University, Chandigarh, India, outside the submitted work. S Shrestha reports other financial or non-financial interests in the School of Pharmacy, Monash University Malaysia, and the Graduate Research Merit Scholarship, outside the submitted work. J Silva reports support for the present manuscript from Portuguese Foundation for Science and Technology through salary payments (contract with reference 2021.01789.CEECIND/CP1662/CT0014). L R Silva reports grants or contracts from project code CENTRO-04-3559-FSE-000162, Fundo Social Europeu (FSE), outside the submitted work. J A Singh reports consulting fees from ROMTech, Atheneum, Clearview healthcare partners, American College of Rheumatology, Yale, Hulio, Horizon Pharmaceuticals, DINORA, Frictionless Solutions, Schipher, Crealta/Horizon, Medisys, Fidia, PK Med, Two labs, Adept Field Solutions, Clinical Care options, Putnam associates, Focus forward, Navigant consulting, Spherix, MedIQ, Jupiter Life Science, UBM, Trio Health, Medscape, WebMD, and Practice Point communications; and the National Institutes of Health; Payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events on the speakers bureau of Simply Speaking; Support for attending meetings and/or travel from OMERACT as a steering committee member; Participation on a Data Safety Monitoring Board or Advisory Board with the FDA Arthritis Advisory Committee; Leadership or fiduciary role in other board, society, committee or advocacy group, paid as a past steering committee member of the OMERACT, an international organisation that develops measures for clinical trials and receives arm's length funding from 12 pharmaceutical companies, unpaid as Chair of the Veterans Affairs Rheumatology Field Advisory Committee, and unpaid as the Editor and Director of the UAB Cochrane Musculoskeletal Group Satellite Center on Network Meta-analysis; stock or stock options in Atai life sciences, Kintara therapeutics, Intelligent Biosolutions, Acumen pharmaceutical, TPT Global Tech, Vaxart pharmaceuticals, Atyu biopharma, Adaptimmune Therapeutics, GeoVax Labs, Pieris Pharmaceuticals, Enzolytics, Seres Therapeutics, Tonix Pharmaceuticals Holding Corp., Aebona Pharmaceuticals, and Charlotte's Web Holdings, Inc. and previously owned stock options in Amarin, Viking, and Moderna Pharmaceuticals; all outside the submitted work. J Sipila reports grants or contracts from Siun Sote Foundation and Eemil Aaltonen Foundation; payment or honoraria for lectures, presentations, speakers bureaus, manuscript writing or educational events from Novartis; support for attending meetings and/or travel from Lundbeck; participation on a Data Safety Monitoring Board or Advisory Board with Boehringer-Ingelheim and Sandoz; stock or stock options in Orion Corp; all outside the submitted work. J Sundstrom reports direct or indirect stock ownership in companies (Anagram kommunikation AB, Sence Research AB, Symptoms Europe AB, MinForskning AB) providing services to companies and authorities in the health sector including Amgen, AstraZeneca, Bayer, Boehringer, Eli Lilly, Gilead, GSK, Göteborg University, Itrim, Ipsen, Janssen, Karolinska Institutet, LIF, Linköping University, Novo Nordisk, Parexel, Pfizer, Region Stockholm, Region Uppsala, Sanofi, STRAMA, Takeda, TLV, Uppsala University, Vifor Pharma, WeMind, all outside the submitted work. A G Thrift reports grants or contracts from National Health & Medical Research Council (Australia), Heart Foundation (Australia), and Stroke Foundation (Australia); outside the submitted work. J H V Ticolau reports leadership or fiduciary role, paid or unpaid, with Benang Merah Research Center, Indonesia, outside the submitted work. S J Tromans reports grants or contracts from NHS Digital, via the Department of Health and Social Care, as payments to their institution; leadership or fiduciary role, unpaid, with the Academic Secretary for the Neurodevelopmental Psychiatry Special Interest Group at the Royal College of Psychiatrists, Editorial Board for BMC Psychiatry, Advances in Autism, Advances in Mental Health and Intellectual Disability, and Progress in Neurology and Psychiatry; all outside the submitted work. P Willeit reports consulting fees from Novartis Pharmaceuticals, outside the submitted work. Y Yasufuku reports grants or contracts from Shionogi & Co, through funding to their institution, outside the submitted work. M Zielinska reports other financial or non-financial interests in AstraZeneca as an employee, outside the submitted work.
