

Supplementary Information

Luminal Rank loss decreases cell fitness leading to basal cell bipotency in parous mammary glands

Ana Sofia Rocha[#], Alejandro Collado-Solé[#] et al.

Supplementary Figures 1-5

Supplementary Figure 1

Supplementary Figure 1: Epithelial Rank deletion reduces the luminal progenitor population without altering fat pad invasion. a, b Genetic constructs of transgenic mouse models generated to delete Rank in basal ($K14^{i\Delta Rank}$ and control $K14^{i mTmG}$) or luminal ($K8^{i\Delta Rank}$ and control $K8^{i mTmG}$) cells and to trace control and Rank-depleted cells. **c** Flow cytometry analyses of GFP-positive cells and tdTomato-positive cells within the basal ($CD49^{hi}/CD24^{low}$) and luminal ($CD49^{low}/CD24^{hi}$) compartments in $K14^{i mTmG}$ (n=7) and $K14^{i\Delta Rank}$ (n = 4) 8 weeks post-dox removal. **d** IF analysis of K8 (magenta) and GFP (green) in $K14^{i mTmG}$ and $K14^{i\Delta Rank}$ MGs. **e** IF analysis of K14 (magenta) and GFP (green) in $K8^{i mTmG}$ and $K8^{i\Delta Rank}$ MGs two days and 8 weeks following dox removal. Dapi stains nuclei (blue). **f** Flow cytometry analyses of GFP-positive and tdTomato-positive cells within the basal ($CD49^{hi}/CD24^{low}$) and luminal ($CD49^{low}/CD24^{hi}$) compartments in $K8^{i mTmG}$ (n = 6) and $K8^{i\Delta Rank}$ (n = 5) 8 weeks post-dox removal. **g** *Rankl* qPCR analysis of flow cytometry sorted luminal cells in $K8^{i mTmG}$ (n = 3) and $K8^{i\Delta Rank}$ virgin MGs. **h** Genetic construct of the transgenic model used to generate constitutive epithelial Rank deletion mouse model ($K5^{\Delta Rank}$ and control $K5^{mTmG}$). **i** IF analysis and quantification of recombination in luminal cells K8 (magenta)/GFP (green) and basal cells K14 (magenta)/GFP (green) in $K5^{\Delta Rank}$ (n = 4) and control $K5^{mTmG}$ (n = 4) mice (8 weeks). **j** Quantification of luminal (K8) to basal (K14) ratio measured by IF in $K5^{mTmG}$ (n=4) and $K5^{\Delta Rank}$ (n=3) virgin glands (8 weeks). **k** IF of PR (green) and K8 (magenta) and quantification of PR⁺ cells within the luminal population in $K5^{mTmG}$ (n=4) and $K5^{\Delta Rank}$ (n=3) virgin glands (8 weeks). Dapi (blue) stains nuclei (**c, d, g, i**). Data are represented as mean +/- SEM. Scale bars and significant *P* values are indicated in the graphs. *P* values were calculated by Two-Way ANOVA with Tukey's multiple comparisons (**c, f, i**) and Unpaired T-test two-tailed (**g, j, k**). Staining was quantified in 5 independent images from two tissues sections collected 100 μ m apart (**i, j, k**). Source data are provided as a Source Data file. n.s = not significant.

Supplementary Figure 2

e)

Supplementary Figure 2: Luminal Rank is critical for functional lactogenic differentiation during pregnancy. **a** IF analysis of K14 (magenta) and GFP (green) in $K14^{i\ mTmG}$ and $K14^{i\ \Delta Rank}$ MGs at L1 of P1, P2 and P3 and relative quantification of GFP/K14-positive cells in the indicated genotypes ($n = 3$). **b** IF analysis of K8 (magenta) and GFP (green) in $K14^{i\ mTmG}$ and $K14^{i\ \Delta Rank}$ MGs at L1 of P1, P2 and P3. **c** IF analysis of K14 (magenta) and GFP (green) in $K14^{i\ mTmG}$ and $K14^{i\ \Delta Rank}$ non-induced mice at L1 from P1. Quantification of GFP+ cells in the luminal population (K8+) of the indicated phenotypes at L1 from P1 compared to non-induced $K14^{i\ \Delta Rank}$ is shown ($n = 3$). **d** Haematoxylin-eosin stainings of mammary glands at L1 from $K8^{imTmG}$ and $K8^{i\Delta Rank}$ mice. **e** IF analysis of K8 (magenta) and Ki67 (green) in $K8^{imTmG}$ and $K8^{i\Delta Rank}$ MGs of virgin mice in control ($n = 3$ $K8^{imTmG}$ and $n = 4$ $K8^{i\Delta Rank}$ mice) and after treatment with estradiol ($n = 3$ $K8^{imTmG}$ and $n = 5$ $K8^{i\Delta Rank}$ mice), MPA ($n = 4$), or prolactin ($n = 3$). Quantification of Ki67 within the luminal compartment is shown. Dapi (blue) stains nuclei (**a, b, e**). Data are represented as mean \pm SEM. Scale bars and significant P values are indicated in the graphs. P values were calculated by Two-Way ANOVA with Tukey's multiple comparisons (**a, c, e**). Source data are provided as a Source Data file. n.s = not significant.

Supplementary Figure 3: Luminal Rank loss leads to the emergence of Rank/tdTomato-positive cells following parity with activated Stat5 signaling. **a** IF analysis of K14 (magenta) and GFP (green) in $K8^{i\ mTmG}$ and $K8^{i\ \Delta Rank}$ MGs at L1 of P1, P2 and P3. **b** IF analysis of K8 (magenta) and GFP (green) in $K8^{i\ mTmG}$ and $K8^{i\ \Delta Rank}$ non-induced mice at L1 from P1. **c** tdTomato IHC following P1, P2 and P3 at L1 in $K8^{i\ mTmG}$ and $K8^{i\ \Delta Rank}$ mice. **d** IF analysis of pStat5 (magenta) and GFP (green) in $K8^{i\ mTmG}$ and $K8^{i\ \Delta Rank}$ MGs at L1 of P1, P2 and P3. **e** Quantification of pStat5 in GFP+ and GFP- cells within the luminal compartment in $K8^{i\ \Delta Rank}$ MGs at L1 of P1, P2 and P3 ($n = 3$). **f** IF analysis of β -casein (magenta) and GFP (green) in $K8^{i\ mTmG}$ and $K8^{i\ \Delta Rank}$ MGs at L1 of P1, P2 and P3. Dapi (blue) stains nuclei (**a**, **b**, **d**, **f**). Data are represented as mean +/- SEM. Each dot represents a mouse. Scale bars and significant P values are indicated in the graphs. P values were calculated by Two-Way ANOVA with Tukey's multiple comparisons (**e**). Staining was quantified in 5 independent images from two tissues sections collected 100 μ m apart (**e**). Source data are provided as a Source Data file. n.s = not significant.

Supplementary Figure 4: Rank deletion in luminal cells results in defective protein synthesis and proliferation upon parity. **a** Flow cytometry cell sorting profile depicting the selection strategy for $K8^{i\ mTmG}$ and $K8^{i\ \Delta Rank}$ GFP+ luminal ($CD49f^{low}$ $CD24^{hi}$) and basal cells ($CD49f^{hi}$ $CD24^{low}$). **b** Heatmap of cell lineage specific genes to confirm the identity of the sorted cells analysed by RNA-seq (samples isolated from luminal $K8^{i\ \Delta Rank}$ mice are highlighted in magenta). **c** GSEA profile of alveolar progenitor differential gene set “G14.5 MG (AVD)” in the indicated genotypes. **d** Bubble plot depicting the variation of cell cycle related gene sets in luminal cells from virgin and parous $K8^{i\ mTmG}$ and $K8^{i\ \Delta Rank}$ mice. **e** GSEA profile depicting the differential regulation of “Ribosome” gene set in virgin and parous $K8^{i\ mTmG}$ and $K8^{i\ \Delta Rank}$ luminal cells.

Supplementary Figure 5

Supplementary Figure 5: Rank/NF- κ B activation is required for basal to luminal transition in parous MGs. **a** Whole mount analysis (carmine aluminium staining) from $K5^{imTmG}$ and $K5^{\Delta Rank}$ MGs at L1 following P1 and P3. **b** GSEA profile of luminal alveolar identity gene set (C4-L-Alv) in virgin and parous Rank+ basal cells (Ba) of the indicated genotypes. **c** Size quantification of basal-derived organoids treated with NF- κ B inhibitors SN50 (18 μ M) and Bay65 (5 μ M). Each dot represents an organoid of one of three independent experiments performed. Representative IF images for K8 (magenta) and K5 (green) in basal-derived mammary organoids treated with NF- κ B inhibitors SN50 and Bay65 are shown. Dapi (blue) stains nuclei. **d** Protocol used to pinpoint the onset of GFP dilution in virgin and parous luminal glands in $K8^{imTmG}$ and $K8^{i\Delta Rank}$ mice. **e** Quantification of the proliferative index of recombined cells (Ki67+/K8+GFP+) in ducts and alveoli from $K8^{imTmG}$ and $K8^{i\Delta Rank}$ luminal cells at G9.5 from P1 (n = 3) and P2 (n = 4 $K8^{imTmG}$ and n = 3 $K8^{i\Delta Rank}$). **f** Quantification of the proliferative index (Ki67+) of GFP+/GFP- alveolar cells of $K8^{imTmG}$ (n = 3) and $K8^{i\Delta Rank}$ (n = 4) mice from an independent experiment. **g** Analysis of apoptosis (by cleaved caspase 3 IHC) in MGs at G9.5 from P1 and P2 of $K8^{imTmG}$ and $K8^{i\Delta Rank}$ mice. **h** Analysis of Rankl expression by IHC and quantification in ducts and alveoli of Rankl-positive cells at G9.5 from P1 and P2 of $K8^{imTmG}$ and $K8^{i\Delta Rank}$ mice (n = 3). Staining was quantified in 5 independent images from two tissues sections collected 100 μ m apart (**e**, **f**, **h**). Source data are provided as a Source Data file. n. s = not significant.
